WinLocalAssistant v55.3.39 Proposed Changes and Validation Plan

Purpose

This report consolidates the requested GUI, audio, project-memory, sandbox, image, validation and defensive-integration improvements into a tracked implementation plan for future WLA passes. It also records which items were implemented in v55.3.39 and which remain as future work.

Area	Implemented in v55.3.39	Remaining / next pass
Audio / speech	Speech no longer reads every reply; it speaks only important/explicit voice replies, strips emoji before speech, and keeps long-report summaries.	Add per-message speaker buttons and voice selection/rate sliders.
Avatar style	Working avatar uses a single icon to avoid the robot/gear wrapping bug shown in the screenshot.	Replace emoji avatar with SVG/Lottie state icons for consistent cross-browser rendering.
Local LLM status	Recent prompt/reply preview no longer flashes back to a loading message; a small spinner shows refresh activity while preserving text.	Add model-call history drawer with exact request IDs.
Quick commands	Quick groups are compacted and resizable; most groups remain collapsed so the panel fits better.	Add drag-and-drop ordering and import/export of quick-command profiles.
Project targeting	New project creation now uses a fresh folder if the generated folder already exists, preventing stale files from contaminating validation.	Add a project-selection dialog before ambiguous code edits.
Simple app validation	Tiny/useful/simple app fallback maps to a utility app instead of game/collision rules or Dodge Game fallback.	Create artifact-type chooser: one-file script, desktop GUI, web app, docs, or data tool.
Linux sandbox	Default Linux sandbox is Python-ready using python:3.12-slim, fixing python3 missing in plain Ubuntu containers.	Add /sandbox-linux install-tools for optional git/jq/ripgrep when network is approved.
Security / AVG	Defensive-only /security-status inventory exists for Defender/AVG-style tooling and safe recommendations.	Add Windows Event Log, Defender history and quarantine summaries; no offensive automation.
Image generation	Existing /image-status explains real backend requirements and does not pretend SVG drafts are AI images.	Add ComfyUI workflow support and a GUI setup wizard.
Live activity	Prior v55.3.36/v55.3.37 added bigger resizable activity, hover context and decision details.	Add timeline filters by run/tool/status and pin important events.
Research synthesis	Prior research improvements added short synthesis before raw source maps.	Add stronger source ranking and primary-source query mode.
Release validation	v55.3.37+ release checklist, doctor and Playwright scaffold exist; v55.3.39 tests confirm GUI/audio/project validation polish.	Make Playwright smoke tests optional release-gate steps when Node deps exist.

Validation ladder used for v55.3.39

```
python -m compileall -q winlocalassistant tests_*.py app.py
```

```
node --check extracted_webui.js
```

```
python -m pytest -q tests_v55_3_39_gui_project_validation_polish.py
tests_v55_3_37_backend_chats_release_project_memory.py tests_v55_3_36_audio_gui_memory.py
tests_release_hygiene.py tests_report_hygiene.py
```

```
python -m pytest -q tests_v55_3_35_integration_radar.py tests_v55_3_35_release_gate_cwd.py
```

```
python -m pytest -q tests_release_hygiene.py tests_report_hygiene.py
tests_v55_3_34_patch_integrity_release_gate.py
```

```
python -m pytest -q tests_v55_3_32_less_strict_sandbox_policy.py tests_sandbox_integration_v55_3_16.py
```

Notes on constrained requests

The requested AVG/cyber-defense integration is implemented only as defensive inventory and guidance. WLA should not automate offensive counterattack behavior. Kali tooling remains appropriate for owned/local lab verification and defensive diagnostics, subject to policy settings.

Outstanding backlog

- Full Playwright release-gate integration when Node deps are installed.

- ComfyUI image generation workflow templates and GUI backend setup wizard.

- Deeper backend conversation search across all saved chats with per-project privacy boundaries.

- True project-type chooser before generation so WLA can create single-file scripts, desktop apps, web apps, docs or data tools based on intent.

- Live Activity timeline filters, pinned event summary and run comparison.
